

Principles of Compiler Construction ()

Dr Mayer Goldberg

September 5, 2016

Contents

1	Course Objectives	1
2	Course Requirements	2
3	Detailed Syllabus	3
4	References	6

- Course number: 201-1-2061
- Mandatory for undergraduate CS and SE students
- Credits: 4.5
- Course site: <http://www.little-lisper.org/website/comp.html>
- Prerequisites: *Principle of Programming Languages* (202-1-2051), *Automata & Formal Languages* (202-1-2011), *Architecture* (202-1-3041)

1 Course Objectives

- Gain additional insight into programming languages, building on what students have learned in the *Principles of Programming Languages* course.
- Understand the major components of the compiler: Syntactic analysis, semantic analysis, code generation, and the run-time environment. Gain hands-on experience in crafting these components.

- Learn about compiler optimizations: What compilers do to generate code that is faster, shorter, and performs better. Implement many of these optimizations, and see how they improve the code.
- Be able to apply information & skills learned in the compilers course to other areas in computer science where syntactic and semantic analysis, code generation, and translation are needed.

2 Course Requirements

- 26 2-hours lectures
- 13 2-hours exercises sessions
- 4 homework assignments [15% of the grade]
 - Written problems in scanning and parsing theory
 - Programming assignments building stages of the compiler, implementing various optimizations, and various exercises in code transformation & translation. About 30 hours each, done singly or in pairs.
- Final project: Writing a code generation, and integrating the previously-written stages of the compiler into a self-contained, working compiler from Scheme to CISC assembly. About 100 hours, done singly or in pairs. [15% of the grade]: **This component is mandatory**
- Midterm exam [15% of the grade]
- Final exam [55% of the grade]: **This component is mandatory**

In this course, for a component of your final grade to be **mandatory** means that you shall fail the course if you fail this component. Here are some examples:

- If you fail the final exam, you shall fail the course.
- If you fail the final project, you shall fail the course.
- If you fail the midterm, but your cumulative grade in the course is 56 or higher, then you shall pass the course.

3 Detailed Syllabus

3.1 Introduction to Compiler Construction

References: 1, 3, 4, 5

- The algebraic relationship between compilation & interpretation.
- Cross-compilation, boot strapping a compiler, de-compilation.
- The stages of the compiler: What work is done in each, what kinds of errors can and cannot be detected at each, the basic algorithms that are implemented at each stage.
- Dynamic vs statically-typed languages. Early binding vs late binding. The information available to the compiler for translation, error detection, and optimizations.

3.2 Scanning & Parsing Theory

References: 1, 2, 5

- Scanner: DFA, NDFA, NDFA with ϵ -transitions
- Parsing: Top-down, recursive descent parsers, parsing combinators, bottom-up parsers
- Hand-coding various parsers
- Using parser-generation tools in C & Java
- Macro expansion: Syntactic transformations, reduction to core forms in the language, variables, meta-variables and syntactic hygiene.

3.3 Programming Languages

References: 2, 3

- Functional vs Imperative programming: How change & side-effects are understood & modelled in the functional view of programming.
- Parameter-passing mechanisms: Call-by-value, call-by-reference, call-by-sharing/object, call-by-name, call-by-need. Features of the various parameter-passing mechanisms, their motivation, history & implementation.

- Scope & its implementation: Dynamic scope (deep binding, shallow binding), lexical scope. Dynamic scope and the implementation of exception handling.
- The structure of the lexical environment, and the implications for data sharing & side effects.
- Object-oriented vs functional programming Languages. The structure of the closure compared to that of the object. Mapping of lambda-expressions to objects. The virtual method table.
- Monads & monadic programming.

3.4 Continuation-Passing Style (CPS)

References: 2, 5

- CPS as a programming technique (multiple return values, multiple continuations, co-routines, implementation of threads.
- CPS as an approach to writing a compiler: CPS, defunctionalization of the continuation, stack machine.
- CPS as an intermediate language for the compiler: Optimizations that are simpler in CPS.

3.5 Semantic Analysis

References: 3, 4, 5

- Lexical addressing, *deBruijn* numbering
- Identification of tail calls
- Boxing, data indirection, and motion from the stack to the heap: A comparison between quasi-functional programming languages (Scheme, LISP) and object oriented programming languages (Java).

3.6 Code Generation

References: 1, 2, 3, 4

- Layout of Scheme objects in memory. Run-time type information. Comparison with the situation in object-oriented programming languages.

- An overview of the proof of correctness of the compiler, and how it is constructed along with the code generator.
- Code generation for the various expressions in our language
- Optimization of tail calls
- The primitive procedures & support code that are provided with the compiler

3.7 The Run-Time Environment

References: 2, 3, 4

- The top level: *n*-LISP – value cells, function cells, property cells, etc.
- Dynamic memory management:
 - Reference counting
 - Garbage collection: mark & sweep, stop & copy, generational garbage collection
- Namespaces, modules, and their implementation

3.8 Compiler Optimizations

References: 1, 2, 3, and notes

- The tail-recursion & tail-call optimizations
- Loop optimizations & transformations
- Array optimizations
- Strength reduction optimizations
- Dead-code removal, write-after-write optimizations
- Common Sub-expression Elimination, both as a high-level and low-level optimization
- Optimizations for super-pipelined and parallel architectures
